

BELLEZA

The Tinted SPF Guide

What the label doesn't tell you —
and how to choose one that
actually works for your skin.

A free guide from Belleza · @shopbellezaco

Sun damage doesn't wait for a beach day.

Sunlight carries two kinds of ultraviolet rays. UVB is the one that burns you. UVA is the one that ages you — and unlike UVB, it passes through clouds and window glass all year.

Research attributes the majority of visible facial aging — wrinkles, dark spots, uneven texture — to UV exposure, not birthdays.

The damage is cumulative. Twenty minutes on a Tuesday counts.

Daily SPF is the single highest-leverage skincare habit there is.

Sunscreen and sheer coverage, in one layer.

A tinted mineral SPF uses zinc oxide and/or titanium dioxide as UV filters, plus iron oxides for the tint.

The tint isn't just cosmetic. Iron oxides do real protective work — more on that next.

The result: one step that protects, evens, and replaces two or three products in your morning.

Three things the tint is doing for you.

Visible-light defense. Iron oxides help protect against visible light, including blue light — a factor dermatologists link to melasma and stubborn hyperpigmentation.

One honest step. Protection plus sheer, skin-like coverage. Fewer layers, faster morning.

A counter to white cast — with a catch. Tint offsets the cast mineral filters can leave. How well depends on how closely the shade matches your skin tone. No formula escapes this.

Three myths worth dropping.

01: ~~"Mineral SPF reflects UV. Chemical absorbs it."~~

Both mostly absorb. The "mirror on your skin" image is marketing, not chemistry.

02: ~~"Mineral means clean. Chemical means dangerous."~~

A leaky binary — many "mineral" sunscreens quietly include chemical filters too.

03: ~~"This one has NO white cast."~~

Cast depends on the formula and your tone. A trustworthy brand states its shade range.

Most people wear half the SPF on the label.

Amount: about a quarter teaspoon for face and neck — the "two-finger rule" is a decent shortcut.

Order: last step of skincare, before or instead of makeup.

Reapply: every two hours of direct sun.

The catch: most people apply 25–50% of the tested amount. Quantity is the whole game.

Three phrases that should make you suspicious.

"No white cast."

Full stop, no shade range attached. Cast depends on your tone as much as the formula — **a claim with no range is a claim about no one.**

"Clean" or "chemical-free."

Every sunscreen is chemicals. "Clean" isn't a regulated term — it's a mood. **It tells you how the brand wants to feel, not what's in the bottle.**

"100% mineral" — in small print.

Independent testing has caught "mineral" SPF's quietly carrying chemical filters. **If the front says mineral, read the full ingredient list before you trust it.**

This isn't for everyone. Here's who should skip it.

Outside the shade range. One shade can't match everyone — a mismatched tint can look ashy. If a brand doesn't state a range, that's your answer.

Want zero coverage. An untinted, cast-minimal formula may suit you better.

Reactive skin. Patch test — iron oxides and filters can irritate.

A quick guide to choosing yours.

IF YOUR SKIN IS

LOOK FOR

Fair to light

Most tinted formulas suit you — match to the lightest shade and check for an iron-oxide tint.

Medium / olive

A tint with warm undertone; test in daylight, since sage-gray casts show most here.

Deep

Prioritize brands that publish a full shade range, or choose an untinted, cast-minimal mineral SPF.

Oily / acne-prone

Lightweight, non-comedogenic texture; a matte or natural finish over dewy.

Dry / mature

A hydrating or serum-textured SPF; avoid heavily mattifying formulas.

Reactive

Shorter ingredient lists; patch test first. Fragrance-free where possible.

General guidance, not a prescription — your skin is the final judge.

My skin profile.

Answer these before you shop. Bring it to the aisle, or keep it on your mirror. One honest picture of what your skin actually needs.

1 — My skin tone is closest to

- ☐ Fair
- ☐ Light
- ☐ Medium / olive
- ☐ Deep

2 — By midday my skin feels

- ☐ Oily / shiny
- ☐ Tight / dry
- ☐ Balanced
- ☐ Combination

3 — I react to new products

- ☐ Often — I'm sensitive
- ☐ Rarely
- ☐ Never

4 — The finish I want is

- ☐ Matte
- ☐ Natural
- ☐ Dewy
- ☐ No coverage

5 — My non-negotiable is

- ☐ No white cast
- ☐ Fragrance-free
- ☐ One-step routine
- ☐ Reef-safe

6 — I'm looking for...

In your words, using pages 5–7.

Belleza

We're developing Sana — a tinted SPF 50 made in one shade, for light-to-medium tones. We say that upfront, because you deserve to know before you're interested.

Sana is in development — coming soon.

You're on the early-access list. Subscribers get first access and a launch discount when Sana is ready.

Thank you for supporting.
